

Programming Assignment #1

Computers are very powerful and can process information very quickly. They are also very “literal” you have to be very clear what you want them to do in a step by step manner. We need to get used to giving good directions in order to write good programs. Write a program as a step by step set of instructions for how **a person** who thinks like a computer should do the following tasks

1. Get from the computer lab side of the closed door to the other side.
2. Brush one's teeth
3. Find their friend in a crowded school (at lunch say).

Remember to assume as little as possible, and make steps as explicit as possible.
