

EXAMPLE:

1. A marble is accelerating down a ramp at a rate of  $3.5 \text{ m/s}^2$ . If it started with an initial velocity of  $0.50 \text{ m/s}$ . How far does it travel in 5.0 seconds?

$$d = v_0 t + \frac{1}{2} a t^2$$

$$= (0.5 \frac{\text{m}}{\text{s}})(5 \text{ sec}) + \frac{1}{2} (3.5 \frac{\text{m}}{\text{s}^2})(5 \text{ sec})^2$$

$$= 46.25 \text{ m}$$

$$= \textcircled{46 \text{ m}}$$

$$a = 3.5 \text{ m/s}^2$$

$$v_0 = 0.50 \text{ m/s}$$

$$t = 5.0 \text{ sec}$$

$$d = ?$$

2. How long will it take a stone to fall from a 20.0 metre building to the ground if it accelerates at a constant rate of  $9.8 \text{ m/s}^2$ ?

$\downarrow$

$$d = v_0 t + \frac{1}{2} a t^2$$

$$d = \frac{1}{2} a t^2 \quad \text{because } v_0 = 0$$

$$2d = a t^2$$

$$\frac{2d}{a} = t^2$$

$$\sqrt{\frac{2d}{a}} = t$$

$$d = -20.0 \text{ m}$$

$$a = -9.8 \text{ m/s}^2$$

$$v_0 = 0 \text{ m/s}$$

$$t = ?$$

$$\pm \sqrt{\frac{2(-20)}{-9.8}} = \pm 2.02 \text{ sec}$$

$$= \textcircled{\pm 2.0 \text{ sec}}$$

$$= \textcircled{2.0 \text{ sec}}$$

Neg is silly

3. A skier, initially at rest, begins accelerating down a hill at  $1.6 \text{ m/s}^2$ . How fast will they be travelling after a distance of 58 m?

$$\begin{aligned}
 \cancel{v_f^2} & \quad v_f^2 = v_0^2 + 2ad & v_0 &= 0 \\
 v_f &= \pm \sqrt{2ad} & a &= 1.6 \text{ m/s}^2 \\
 &= \pm \sqrt{2(1.6 \frac{\text{m}}{\text{s}^2})(58 \text{ m})} & d &= 58 \text{ m} \\
 &= \pm \sqrt{185.6 \frac{\text{m}^2}{\text{s}^2}} & v_f &=? \\
 &= \pm 14 \text{ m/s} \rightarrow \boxed{14 \text{ m/s}}
 \end{aligned}$$

4. A parachutist falls 215 m in 7.0 seconds after leaving the plane. If she is constantly accelerating what is her speed after 7.0 seconds?

$$\begin{aligned}
 d &= \bar{v}t \rightarrow \frac{d}{t} = \bar{v} & d &= -215 \text{ m} \\
 \frac{-215 \text{ m}}{7.0 \text{ sec}} &= -30.7143 \text{ m/s} & t &= 7.0 \text{ sec} \\
 & & v_f &=? \\
 & & v_0 &= 0 \text{ m/s}
 \end{aligned}$$

$$\bar{v} = \frac{v_f + v_0}{2}$$

$$2\bar{v} = v_f \rightarrow -61.4 = v_f$$

Speed is 61 m/s

5. A car accelerates from rest to a top speed of 42 m/s in 4.0 seconds and then drives at that speed for 25 seconds. How far will they have travelled in total?

Part 1  $\bar{v} = \frac{v_f + v_o}{2} = \frac{42 \text{ m/s}}{2} = 21 \text{ m/s}$

$$v_f = 42 \text{ m/s}$$

$$v_o = 0$$

$$d = \bar{v} t = \frac{21 \text{ m}}{\cancel{s}} \times 4.0 \text{ sec}$$

$$= \textcircled{84 \text{ m}}$$

~~answer~~

$$t = 4.0 \text{ sec}$$

$$d = ?$$

Part 2

$$d = \bar{v} t$$

$$= \frac{42 \text{ m}}{\cancel{s}} \times 25 \text{ sec}$$

$$= \textcircled{1050 \text{ m}}$$

$$\bar{v} = \frac{42 \text{ m/s}}{42 \text{ m/s}}$$

$$t = 25 \text{ sec}$$

$$\text{Total: } 84 \text{ m} + 1050 \text{ m} = 1134 \text{ m}$$

$$\approx \textcircled{1100 \text{ m}}$$

Quadratic formula problems

If we are solving for time using the equation  $d = v_0 t + \frac{1}{2} a t^2$  and initial velocity is not zero, then we need to use the quadratic formula to solve the problem.

**Example:**

How long will it take a stone to fall from a 20.0 metre building to the ground if it accelerates at a constant rate of  $9.8 \text{ m/s}^2$  downwards and it was thrown upwards initially with a velocity of  $15.0 \text{ m/s}$ ?

$$d = v_0 t + \frac{1}{2} a t^2$$

$$\text{Want: } ax^2 + bx + c = 0$$

$$0 = v_0 t + \frac{1}{2} a t^2 - d$$

$$0 = \frac{1}{2} a t^2 + v_0 t - d$$

$$0 = \frac{1}{2} (-9.8) t^2 + 15 t - (-20.0)$$

$$0 = -4.9 t^2 + 15 t + 20$$

$$\frac{-15 \pm \sqrt{15^2 - 4(-4.9)(20)}}{2(-4.9)}$$

$$v_0 = 15 \text{ m/s}$$

$$a = -9.8 \text{ m/s}^2$$

$$d = -20.0 \text{ m}$$

$$t = ?$$

$$\frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$t = -1.0 \text{ sec}$$

or

$$4.06 \text{ s} \approx \boxed{4.1 \text{ sec}}$$
