

# Water Cycle

All the water, water vapor, snow, and ice on Earth is called the **hydrosphere**.

The hydrosphere is only about 0.02% of the Earth's total mass.

The water cycle is the transfer of water from one part of the hydrosphere to another.

Water from the ocean evaporates into water vapor and is pushed by wind.

The water vapor eventually condensates and forms clouds.

The water from these clouds falls back into the ocean and onto land.

The water on land flows back to the ocean.
